

Assignment 1: Internet Explorer

Date: 09/02/2026

Description: Draw and explain the client-server architecture and trace what happens when you open a website.

Client–Server Architecture

Client–Server Architecture is a computing model in which a client requests services or resources and a server responds to those requests over the internet.

Components:

- Client: User device such as a web browser
- Server: Stores and serves web pages
- Internet: Communication medium
- Protocol: HTTP/HTTPS rules for communication

What Happens When You Open a Website?

- 1 User enters a URL in the browser.
- 2 DNS translates the domain name into an IP address.
- 3 Browser sends an HTTP/HTTPS request to the server.
- 4 Server processes the request.
- 5 Server sends an HTTP response back to the client.
- 6 Browser renders the web page.

This process allows users to view websites quickly and efficiently using the client-server model.
